

Agree or disagree : Industrialization has had an overall beneficial effect on humankind

Industrialization has been controversial for the last few decades. Although there are pros and cons regarding this issue, I agree accelerating industrialization has had a positive impact on society for the following three reasons.

First, robotic technology has been positively influencing various industries. For example, a growing number of construction companies have been relying on robots **to** replace humans due to a lack of workforce. Thanks to this state-of-the art technology, many companies has been flourishing despite lower birth rates.

Second, industrialization plays a significant role in tackling global warming **by** reducing CO2 emissions. For instance, an increasing number of auto giants have been producing electric vehicles to cut greenhouse gases. This leads ordinary people to purchase eco-friendly cars at a lower cost.

Finally, industrialization contributes to eliminating poverty on the globe. Many developed countries have been sending experts in agriculture to developing nations to provide advanced skills and equipment. They have been enlightening local farmers **on** how to grow vegetables effectively under harsh weather conditions. As a result, underdeveloped countries might be independent economically.

In conclusion, in terms of robotic technology, dealing with global warming and the elimination of poverty, industrialization has been having a positive effect on our society.

~~~~~

They contribute to worsening environmental conditions.

fast fashion = inexpensive clothing that is produced quickly because of quick-changing trends. Fast fashion commonly uses cheaper materials which include plastic (polyester). Fast fashion is a major contributor to microplastics in the ocean, in the air, and on the land.
